IT ALL BEGAN IN 1853...

The Norwegian outdoors, culture and craftsmanship are key parts of our DNA. The essential ingredients that define the soul of Jøtul are our passion for heat combined with the skills and traditions of 170 years of working with cast iron to make everyday tools.

NORWEGIAN CRAFTSMANSHIP SINCE 1853

Jøtul is one of the oldest producers of wood stoves, fireplace inserts and fireplaces in the world. Building on a proud Norwegian tradition, we have been combining fine craftsmanship with the art of coping with the cold since 1853.

Cast iron – lasting quality

Jøtul's product development team always keeps "Design for Manufacturing" top of mind. Our products are made of recycled cast iron and the main principle is that it must be possible to design and produce everything that we make. Our products always meet all test requirements and approval criteria and must be able to live up to our customers' high expectations.

Espen Auensen, Research and Development Manager at Jøtul

"No two castings are exactly the same which means that each product is unique."

NORWEGIAN CULTURAL HERITAGE AND CRAFTSMANSHIP

Norwegian cultural heritage and craftsmanship are core elements of what Jøtul stands for. We therefore always use Norwegian designers and have in-house project engineers. One of the most important jobs they do is to design a product that is then crafted in cast iron. This involves close collaborative working between the modelling workshop, laboratory and production. Interaction and good dynamics are key to the progress of the projects and to enabling the development of high-quality products.

"We have our own modelling workshop and foundry right next door to our development facility, allowing the departments to work efficiently and give each other feedback throughout the development process."

Thomas Johannesen,
Product Developer
at Jøtul.

ENVIRONMENTALLY AWARE WITH CLEAN BURN TECHNOLOGY

Thanks to a continuous focus on research, development and testing, Jøtul is now a world-leader within Clean burn Technology. But why is it so important to be 'best in class' regarding clean burn wood stoves, fireplaces and fireplace inserts?

Well, first and foremost, it is a question of improving the climate, by reducing airborne dust to a minimum. This is followed by saving consumers money, because Clean burn Technology gives you more heat per log.

RECIRCULATED HEAT

Reuse, recirculation, circular economy, climate impact and sustainability. These are core values which are deeply entrenched in our philosophy and set the agenda for the way in which Jøtul is managed today and how we are preparing for the future. It makes it easy for the consumer to make environmentally friendly choices when they invest in a new wood stove or fireplace.

We are the only stove manufacturer anywhere in the world to manufacture wood stoves, fireplaces and fireplace inserts with renewable energy in the form of Norwegian hydropower. A significant proportion of the raw materials we use consist of old cast iron stoves which have been melted down for recycling. The recycled stoves are basically taken into the factory at one end and come out at the other as modern, clean burn versions at the other. If we also take into account the fact that wood-firing is CO₂-neutral, we can safely claim that Jøtul's stoves are a sustainable resource!

René Christensen,
Senior Vice President
Sales and Marketing
at Jøtul.

"It is our corporate social responsibility to contribute to a healthier climate and the green switch. As more and more consumers want to make their choices based on the environment and sustainability, we want to help them make those choices by offering environmentally friendly products, manufactured in an environmentally friendly way."

COMPACT CLASSIC WITH NEW TECHNOLOGY

Warm, classic design and heating technology from the top shelf - these have been Jøtul's core values for more than almost 170 years. And now we have once again fine-tuned one of our most beloved models with state-of-the-art combustion technology, built for the environmental requirements of the future.

JØTUL F 100 ECO.2 SL / LL

Jøtul F 100 ECO.2 is characterized by a Norwegian traditional pattern, which frames the flames in a horizontal glass door with good visibility. The stove is compact and fits most heating needs well. The stove has a smart internal ash solution that makes removing the ashes an easy job, without ash spills.

Available in short (SL) or long leg (LL) options to suit hearth requirements.

REINVENTING A CLASSIC

Based on the exterior of one of Jøtul's best-selling classics, Jøtul F 200-series has brought a piece of the heritage and almost 170 years of experience with heat, and given it a modern interpretation.

You can easily control the air flow with just one lever and emptying of ash is made simple with an easily accessible ash solution at the bottom of the combustion chamber.

WOOD STOVES WITH CHARACTER

Jøtul F 105 and F 305 combines almost 170 years of experience in making functional wood stoves with top notch design. The stoves have an unmatched view to the fire and their large burn chambers make it easy to position logs and kindling. They combine radiated and convected heat, making it easy to position and ensure a pleasant room temperature. An ash lip and soapstone top can be fitted as an optional accessory on some of the models.

EFFICIENCY: 83 %

ECOLABEL: **A+**

LOG SIZE: 33 CM

EFFECT NOMINAL: 4.5 KW

JØTUL F 105 SL / LL

The Jøtul F 105 series has a confident and friendly appearance. In spite of its size the Jøtul F 105 is a wood stove that stands out from the rest. Some of the distinctive design elements of this wood stove include the large horizontal glass door, which offers a great view to the fire and the intuitive air controls that make it very user friendly. Standing on legs it has a light appearance, perfect for smaller rooms.

ACCESSORIES:

Soapstone top, ash lip, handle for ashpan, external air kit, heat shield and short legs. Universal heating top.

COLOURS:

ZENSORIC AUTOMATIC AIR CONTROL

The Jøtul F 170 with Zensoric puts ease of use and comfort at the forefront because it automatically adjusts the draft and even signals when it's time to add more wood.

Zensoric air control is controlled by a temperature sensor which ensures that the correct amount of air is supplied to the stove at exactly the right time to optimize combustion of the wood. Additionally you may add fuel to suit your own heating requirements.

ZENSORIC GIVES YOU:

- Ease of use
- Lower emissions
- Even heat and longer burning time
- Cleaner glass
- Less ash

Read more about Zensoric

When it's time to add more wood, the wood stove notifies you with a green light signal.

Zensoric is powered by a motor that is easily charged with a USB-C charger.

It only needs to be charged once per wood burning season normal use.

JØTUL F 171

The stylish shape and revolutionary firing technology make this wood burning stove both functional and aesthetically pleasing. Self-closing door with magnetic lock and a reminder when more wood needs to be added make this wood burning stove both safe and easy to use.

MODERN FIRING TECHNOLOGY

This wood-burning stove has simple, clean lines, which give it a timeless expression. Hareide Design has utilised the design-friendly properties of cast iron and designed a stove with a soft overall impression and great flame view. The cool-to-touch handle is located on the top of the door. Jøtul F 230 series benefits from ground-breaking combustion technology, which allows for easy installation. Integrated supply air through third party concentric flue system makes the Jøtul F 230 ideal for new, modern low energy houses built according to today's stringent requirements.

GAS – CLEAN & CONVENIENT

Jøtul gas products offer quick and efficient heating. The range consists of a classic and a modern gas stove in balanced flue versions all with the same high standard of finish and cast iron as found on our wood burning products. Gas allows instant heat without any preparation or cleaning, after a long day at work your room can have a glow within seconds of arriving home.

Balanced flue means venting the stove vertically through a roof or horizontally through an adjacent wall. Jøtul gas appliances are made with top quality recycled cast iron produced by our foundry in Norway. The technology and manufacturer of the finished products is at Jøtul North America, Portland, Maine where they have been pioneers in gas fire technology for the last 15 years and whose innovation include the trademarked Jøtul Heat fin and Jøtul burner system. Before you consult your Jøtul dealer determine how large your room is in cubic metres and determine where you would like to site the appliance.

Clean & Instant

Jøtul gas products offer an alternative to their wood burning cousins, still offering the same aesthetics and high standard of build quality but in a clean and convenient fuel option.

For convenience, turn on your stove in a few seconds and modulate the power of the device according to the temperature chosen with the remote control.

JØTUL GF 373 BF CE

The Jøtul GF 373 gas stove stands out with its modern aesthetics and pedestal base. Its unique line can be enhanced by the choice of a white enameled cast iron version. A mirrored interior gives greater depth and brightness to your view of the flames. For convenience, turn on your stove in a few seconds and modulate the power of the device according to the temperature chosen with the remote control.

WHAT TO CONSIDER WHEN INSTALLING A STOVE

Here are some issues that you should think through or investigate before you start the process of buying a new stove. They are relevant whether you go to one of Jøtul's network of dealers or if you want to do most of the work yourself (subject to planning permission).

Heating effect and living area

In order to get the most enjoyment from your stove, it is very important that the size is right for your living area and heating needs. If the stove is too big, you will constantly be using it shut down because you will not need the heat and end up with soot on the glass and in your chimney because it is not being run hot enough. (Please see the information on our clean-burn system). If the wood stove is too small, it will be over fired and its lifetime will be considerably reduced due to the excessive heat.

The dealer needs information about living area and type of insulation in your home in order to give you good advice. Normally, the need for heating in UK homes is about 1 kilowatt for every 14 cubic metres. To work out your requirements, multiply your room width and length measured in metres, by your room height in metres (i.e. 5m x 7m = 35 x 2.5m = 87.50). This means that your room, with a

normal sized window and number of doors, has a volume of 87.5 cubic metres and will need approximately a $(87.5 \div 14)$ 6 kW Jøtul stove. This can be reduced or increased by type of insulation, the number of windows, ceiling height and so on.

Ventilation

In order to function properly, the stove needs air. The chimney pulls air through the stove, but if your house is very well sealed and insulated, or if mechanical ventilation is fighting the natural draught in the chimney, you can experience problems with the function of the stove. The recommended solution is to connect so-called "outside air" or "closed combustion" to the stove.

If you live in a house with new and tight insulation or have mechanical extraction, it is important that you consider this when you plan the installation of your stove.

Window glass and insulation

Old and draughty houses with poor insulation need considerably more heating than houses with proper insulation and triple glazed windows. The scope of the heat loss in your home is something that you know best, but if you reside in a low energy house or a newer house, it is important to choose a stove that works well on low effect.

The Jøtul F 160 series is a great example of these type of wood stoves - it burns optimally even at 3 kW.

Chimney

Most problems with stoves stem from the chimney having incorrect dimensions or not working properly. In order for a stove to work optimally, a chimney should be sized and fitted correctly, in accordance to UK building regulations.

In the installation and User Guides you find information about the necessary draught for the different products to function optimally.

A rule of thumb is that 1 metre of chimney creates 4 Pascal of draught. Few stoves can function on less than 12 Pascal. Sharp bends on the flue outlet reduces the draught. If you are unsure about how your chimney works, the Jøtul retailer or the Chimney Sweep Association can help you. You can also get help to renovate or line your old chimney or alternatively install a steel chimney. Steel chimneys are reasonably priced and a satisfactory alternative to the traditional brick chimney.

Where the stove should be installed

Different stoves have different features. Some are designed to be placed close to flammable material, while others require a fireproof barrier in order to be placed close to the wall. A drawing that shows where the stove should be placed in relation to the chimney outlet, fireproof wall and furniture will be of great help when you seek advice with the experts.

Suitable hearth requirements

Most of Jøtul's wood stoves are tested to EN 13240, part of which requires that the stove does not increase the temperature of the hearth the stove is sited on above 100 degrees centigrade. Current UK building regulations state that if an appliance does not raise hearth temperature above 100 degrees centigrade then the hearth does not need to be constructional and a supplementary hearth may be used. Your Jøtul dealer or local building control officer should be consulted for clarification and further instruction.

Installation

In the UK the installation should be carried out by a competent registered installer or signed signed off by your local building control inspector.

Talking to professionals from our network of dealers early on, can save you both time and money. They can give you useful advice that is fit for your needs, your living situation and of course, your budget. They are relevant whether you go to one of Jøtul's network of dealers or if you want to do most of the work yourself (subject to planning permission).

DO YOU NEED HELP WITH INSTALLATION?

The Jøtul retailer often offers a complete installation service to ensure that the fireplace is installed according to all regulations. The product is delivered with with a QR code to access installation instructions.

The fireplace must be inspected by a Hetas qualified installer or your local building control inspection authority, before use. After installation the product must be registered with Hetas to report that changes were made to an existing fireplace or a new one was installed.

25 YEARS GUARANTEE!

We wish to offer our customers the best of the best, and for this reason all products are handmade from the best available materials.

The exceptional durability is the reason that Jøtul offers a 25 year warranty against failure due to faulty manufacture - the longest on the market.

Cast iron fireplaces have a basic 5-year warranty on external castings. You may extend the warranty on external cast-iron parts to 25 years by registering your purchase within three months of purchase. All enquiries must go through a Jøtul dealer.

Warranty includes all components except consumables (grates and flame path equipment) and does not include labour.

We refer to full terms and conditions on our webpage:

jotul.co.uk/25-year-warranty-registration

INTERNET POLICY

Jøtul's products are sold through a network of highly trained retailers, able to offer you the very best advice on the most suitable stove for your individual needs and circumstances, with the option of installation and appropriate after sales service for your purchase.

In order to ensure that you benefit from this, we do not recommend purchasing a Jøtul stove over the Internet where this level of advice and service may not be available.

If you do decide to buy your stove over the Internet, ensure that you buy from a dealer who can offer expert advice on the most suitable product for your needs, and who is able to install your stove and service it when necessary.

In particular, we would suggest that you avoid buying Jøtul stoves over the Internet, especially from a retailer who is not local to you, and who is, therefore, unlikely to be able to provide you with the appropriate support.

UNIVERSAL HEATING TOP AS OPTIONAL EQUIPMENT

Turn your wood stove into a multifunctional unit with the Jøtul Universal Heating Top. The heating top is mounted on top of the stove and allows you to enjoy hot meals and keep the tea piping hot while enjoying the nice atmosphere.

HEAT STORAGE SYSTEM

Thanks to heat retaining stones placed in the top of the stove it can give up to 12 hours extra heat after the last load of wood. Light the fire in the morning and go to work, when you get home, it is still warm.

GET THE FIRE STARTED EVERY TIME

Start the fire from the top! Correct wood burning is more environmentally friendly, reduces costs and increases fire safety.

Starting the fire from the top provides quicker heating of the burn chamber, which provides proper draft in the flue and pipe quickly, more oxygen to the flames and higher temperature. The flames on the top heats up the logs underneath so that they release the gasses that make the fire burn and keep on burning. Use firelighters to ensure rapid lighting of the kindling wood on the top. In this way, you will avoid unnecessary smoke in the kindling phase.

Slow kindling and low temperature lead to an increase in airborne dust that is many times multiplied.

How to build a fire

Use logs of dry wood on the bottom and a mix of kindling wood and a couple of firelighters on the top. Finish it off with a large log.

Use dry wood

A rule of thumb is that dry wood is lighter and has deeper cracks. When hitting two logs against each other, it should sound like a bat hitting a ball. If you use wood with a higher moisture content (more than 20%), the emissions of soot and particles will be 10 to 30 times higher than if you use dry wood.

Light the fire from the top

Lighting the fire from the top will make the burn chamber heat up faster. Consequently, you get a nice draft in the flue and pipe, more oxygen for the flames and a higher temperature.

Make sure there is enough air

Make sure there is enough air in the house, so that the woodstove has enough air for the combustion process.

Kitchen fans and ventilation systems that pull air out of the house will reduce the draft in the chimney.

Open up all vents in the woodstove. Feel free to open the door slightly for up to 5 minutes until the fire is burning properly. When the fireplace is warm, after about 15 minutes, the vents can be adjusted again. It is important not to shut the damper (if used) too much, as this will suffocate the flames. The wood should always burn with a visible flame. Fires without flames emit twice as much soot and particles.

USE 40% LESS WOOD

Jøtul's clean burning fireplaces and stoves are more efficient and require much less wood than the "old" non clean burning, to produce the same amount of heat.

If you burn correctly, this can mean a reduction in wood consumption by up to 40 %. The environmental clean-burning stoves are entirely positive.

They reduce particulate emissions by 90 % set against old fireplaces. The dual combustion system also allows the gases and particles burning up before they go up the chimney.

QUALITY OF JØTUL ENAMEL

Jøtul was the first manufacturer on the market with porcelain enamel for wood stoves more than 50 years ago. Durable, semi-gloss porcelain enamel surfaces are not only the best, but also the most beautiful. It highlights the contrast between textured and smooth surfaces in a very aesthetic way.

"An enamelled surface is durable and maintenance-free"

EFFICIENT HEAT

Jøtuls clean burning fireplaces and stoves work well at low effect in terms of efficiency and particulate emissions. Since the stoves are more efficient they also use less wood so that the cost for heating is reduced. Jøtul offers a wide range of stoves that are ideal for new homes.

ECOLABEL

The Ecodesign - and the Ecolabel Directive are two instruments initiated by the EU. They aim to reduce the environmental impact of energy-related products throughout their life cycle. This allows you to choose the most energy-efficient wood stove on the market.

Marking our products with their energy-efficiency class will guide you to choose the most energy-efficient product, with the lowest operating cost and impact on the environment. All in order for you to make your best choice for the present, - for the future and for the environment.

WOOD-FIRING - A CLIMATE-FRIENDLY ALTERNATIVE!

Most people want to make climate-friendly choices on behalf of the next generation. It is therefore good to know that wood is a renewable, low mileage resource, and that our clean burn, wood-based stoves and fireplaces are environmentally friendly products. This makes it particularly satisfying to settle down with a good book in front of your stove or fireplace and simply enjoy the sound of the crackling fire. The sound of contentment!

A RELIABLE SOURCE OF HEAT THAT YOU CAN DEPEND ON

The history and tradition of Jøtul mean a lot to our customers, our partners and to us who work here. Our commitment to quality, innovation, safety and environmental protection are the pillars of our production, from concept to end product.

Thanks to these core values, you can rest assured that your product will be a reliable source of heat for many years to come.

RADIATION OR CONVECTION HEATING?

Did you know that different woodstoves create different types of heating? And they work in very different ways.

Research shows that people are most comfortable in a room where they feel warm up to chest height, but where the air is not too heavy to breathe in.

Most cast iron woodstoves provide radiation heating. The rays of heat will heat people, surfaces and objects in a room, and it works quickly. Radiation heating is ideal for rooms with high ceilings. It creates an

even heat where needed, so neither your feet nor your nose need to be cold. The concept of convection heating will draw cold air in under the woodstove, heat it up between double sidewalls and release it on the top. The heat rises to the ceiling and will gradually be “pressed” down. In the beginning your head will feel warmer than your feet. Convection woodstoves are a good choice if you want to place the woodstove near flammable materials or don’t have a firewall behind it.

Radiation heating

Convection heating

SYMBOLS

DEFRA exempt

Department for the Environment, Food & Rural Affairs. Exempt stoves are models that are cleared to burn specialised fuels in smoke control areas, fuels that would normally be disallowed. Many of our new ranges, such as our Cleanburn range of stoves, are designed and fitted with technology that means wood can be legally burnt within a smoke control area.

Clean burn

This means that fireplace has a dual combustion system that converts up to 90% of the gases and particles in smoke to heat. This provides the absolute minimum level of smoke emission because the fireplace uses the energy to give heat instead of smoke.

Closed combustion

Products with closed combustion system takes air through a separate air channel directly from the combustion chamber and through an outside wall or through the floor.

40 % Less wood

Modern wood stoves have 40 % more efficient combustion and 90 % fewer emissions than old fireplaces.

TECHNICAL INFORMATION – ALL THE DETAILS

Choosing a Jøtul stove is supposed to be easy. This is why we have chosen to provide a detailed overview of everything you need to know before making your choice. The manual is always to be used for installation, but the sketches in this section will give you a good technical overview.

Measurements and Clearances state the dimensions of the product and distances to be taken into consideration when assembling. Jøtul recommends a furniture distance from fireplace at minimum 1000 mm.

Our dealers are highly competent and are always available if you have any questions.

** SL requires constructional hearth with 350 mm projection from stove glass.

HOW TO SCAN QR-CODES

To find user guide, assembly instructions and other documentation, please scan the QR code below the product

1. Use a QR-scanner app downloaded from Google Play or App store // IOS users: Open the default camera app
2. Hold your device so that the QR code appears in the window
3. Tap the notification to open the link

FIND ALL DOCUMENTATION ONLINE

There are many things to consider when buying and installing a new wood stove or fireplace. Do you have a standard flue or not, are you going to place the stove on a wall or in a corner, whether you have recessed or exposed firewall or not one at all? Find help and guidance on our website.

Select product, click **Technical Specifications**. Here you will find everything from weight to performance.

Documents gives you access to all manuals, floor plan drawings and any technical documents you may need.

All documentation on our products is always available on our web pages at jotul.uk
Or by scanning the QR-code under the product.
